

# Averis x Monash Hackathon 2026 — Final Round Judging Criteria

*Use this page as a quick reference. The full rubric follows on the next page.*

## Scoring overview

**100 points total: Technical 70 points • Product & Impact 30 points**

The largest single criterion is End-to-End Functionality at 25 points.

## Criteria at a glance

Technical (70): End-to-End Functionality 25 | Architecture & Scalability 15 | Technology Integration 15 | Engineering Quality & Robustness 15

Product & Impact (30): Solution Effectiveness & User Value 10 | User Experience & Differentiation 10 | Impact & Future Potential 10

## How to mark

- Score all seven criteria using whole numbers.
- Use the performance bands as guidance and score each criterion independently.
  - Do not reward the same evidence twice.
- Base scores on what is demonstrated, submitted or clearly explained.

Working draft — “Technology Integration” is provisional and will be finalised after sponsor alignment.

| Category           | Weak | Developing | Strong | Excellent |
|--------------------|------|------------|--------|-----------|
| 10-point criterion | 0–2  | 3–5        | 6–7    | 8–10      |
| 15-point criterion | 0–3  | 4–7        | 8–11   | 12–15     |
| 25-point criterion | 0–6  | 7–12       | 13–18  | 19–25     |

## TECHNICAL — 70 POINTS

| No. | Criterion                        | Max | What judges assess                                                                                                                                             | Weak                                                                                                                              | Developing                                                                                                                                          | Strong                                                                                                                                    | Excellent                                                                                                                                        |
|-----|----------------------------------|-----|----------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | End-to-End Functionality         | 25  | How completely and reliably the finished solution works across its main user and system flows.                                                                 | Major flows are broken, missing or depend heavily on mock-ups or manual substitution.                                             | Core features work, but several flows are incomplete, fragile or require workarounds.                                                               | Main flows work end-to-end with only minor issues.                                                                                        | The finished solution works reliably end-to-end with major features and integrations functioning as intended.                                    |
| 2   | Architecture & Scalability       | 15  | How well the system is designed, including component structure, data flow, dependencies and ability to grow.                                                   | Architecture is unclear or poorly suited to the solution.                                                                         | The design is workable, but key decisions or scaling needs are unclear.                                                                             | Clear architecture with sensible component separation and scaling decisions.                                                              | Well-justified architecture with clear trade-offs and a realistic scaling approach, supported by the implementation or other technical evidence. |
| 3   | Technology Integration           | 15  | How appropriately and effectively the chosen technologies, tools, libraries, and APIs are integrated to solve the problem, with no restrictions on tech stack. | Technology choices are poorly justified or mismatched for the problem; integration is superficial, broken, or primarily cosmetic. | Technologies are functional within the project, but the integration is basic, relies heavily on boilerplate code, or shows limited technical depth. | Technologies are well-chosen and effectively integrated; components communicate cleanly and meaningfully contribute to the core solution. | Deep, seamless integration of modern or complex technologies; tools are leveraged to their full potential with strong technical craftsmanship.   |
| 4   | Engineering Quality & Robustness | 15  | Quality and reliability of the implementation, including testing, error handling, security and performance where relevant.                                     | The implementation is fragile, with little evidence of testing or error handling.                                                 | Basic safeguards are present, but reliability or testing is limited.                                                                                | The implementation is tested and handles common errors reliably. Security and performance are considered where relevant.                  | The implementation is well tested, reliable and handles failures appropriately, showing strong engineering discipline.                           |

## PRODUCT & IMPACT — 30 POINTS

| No. | Criterion                           | Max | What judges assess                                                                                                              | Weak                                                                       | Developing                                                                       | Strong                                                                           | Excellent                                                                                                  |
|-----|-------------------------------------|-----|---------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|----------------------------------------------------------------------------------|----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| 5   | Solution Effectiveness & User Value | 10  | How well the finished solution addresses the problem statement and delivers useful value to its intended users or stakeholders. | The solution does not clearly address the problem or deliver useful value. | The solution addresses part of the problem, but value is limited or unclear.     | The solution clearly addresses the problem and provides meaningful value.        | Strong problem-solution fit with clear evidence that the finished solution provides meaningful value.      |
| 6   | User Experience & Differentiation   | 10  | How easy the solution is to use and how meaningfully it differs from common alternatives. Consider both equally.                | The experience is confusing and the solution shows little differentiation. | The solution is usable, but either the experience or differentiation is limited. | The main experience is clear and intuitive, with meaningful differentiation.     | The solution is polished, intuitive and clearly differentiated in a way that improves the user experience. |
| 7   | Impact & Future Potential           | 10  | Potential for measurable impact, adoption and continued development beyond the hackathon.                                       | There is little credible impact or path beyond the hackathon.              | Some potential is visible, but assumptions or next steps are vague.              | Clear impact potential with realistic next steps and useful measures of success. | Strong impact potential with a credible adoption or growth path and clear measures of success.             |

Scoring note: use the performance bands as guidance and award a whole-number score within the relevant range. Score each criterion independently and avoid rewarding the same evidence twice.

Final Round Judge Score Sheet

For printed use: write one whole-number score per criterion and add the totals.
